

Dear Hiring Team,

I am excited to apply for the Frontend Developer position. I am a Frontend Developer with hands-on experience building responsive and interactive web applications using JavaScript, TypeScript, React, Next.js, Tailwind CSS, and GSAP. I enjoy not only implementing designs, but also solving the underlying UI and interaction problems that make an application feel complete and reliable.

My first substantial practical experience came from a freelance e-commerce project for a Ukrainian client, where I worked primarily with HTML, CSS, Vanilla JavaScript, and some jQuery. I was responsible for a significant part of the frontend functionality, including burger menus, nested categories, product filtering, form validation, responsive layouts, and complex scroll-based behavior.

One of the more challenging parts of the project was implementing a dynamic header whose behavior changed depending on the page and the user's scroll position. I had to handle different layouts, fixed states, navigation menus, dynamic spacing, and different scroll thresholds across product, category, and homepage views. I also built a custom product slider from scratch without using a slider library, including dynamic pagination, navigation, responsive behavior, and the ability to switch between grid and slider layouts depending on the page and screen size. This experience taught me to approach frontend development as problem-solving rather than simply translating a design into code.

Since then, I have expanded my stack significantly. I currently work with React, TypeScript, Next.js, Tailwind CSS, TanStack Query, REST APIs, and GSAP. I am also completing the UniLab React Acceleration Program, where I am working on multiple production-oriented projects for real clients. These projects involve React/Next.js development, TypeScript, responsive UI implementation, API integration, reusable components, and interactive interfaces.

I also have experience developing projects independently, including an interactive GSAP-based cocktail website, a startup project built with Next.js and TypeScript, frontend form-validation projects, and other responsive web applications. I maintain my code on GitHub and actively focus on writing structured, maintainable code rather than putting all application logic into a single file or component.

What I believe I can bring to a frontend team is strong curiosity, a practical problem-solving mindset, and the ability to learn technologies by actually building with them. When I encounter a difficult task, I am comfortable researching the problem, understanding why a solution works, and improving the implementation rather than stopping at the first working result.

I would be happy to discuss my experience, walk through my projects, and explain the technical decisions behind them.

Thank you for your time and consideration.

Best regards,
Lana Shotashvili
